No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 26, sequence 26, sequence 26, sequence 26, sequence 26, sequence 5, sequence 2, s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4,

Sequence 2, Application US/09374597

Patent No. 6140082

GENERAL INFORMATION:

APPLICANT: Loosmore, Sheena M.

APPLICANT: Yacoob, Reza K.

APPLICANT: Zealey, Gavin R.

APPLICANT: Riein, Michel H.

TITLE OF INVENTION: Expression Of Gene Products From

TITLE OF INVENTION: Genetically Manipulated Strains Of Bordetella

NUMBER OF SEQUENCES: 56

CORRESPONDENCE: Sim & MCBULNEY

STREET: 330 University Avenue, 6th Floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 103;
                                                                  COMPUTER READABLE FORM:

C.Complex: the cholera enterotoxin molecule contains three kinds of chains; an alpha ciate noncovalently with the subunit B, an aggregate of five beta chains
C.Function:
C.Function: involved in binding of the toxin to cell membranes
C.Superfamily: cholera enterotoxin beta chain
C.Superfamily: cholera enterotoxin toxin
F.1-21/Domain: signal sequence #status predicted <SIG>F:22-124/Product: cholera enterotoxin chain B #status predicted <MAT>
F.30-107/Disulfide bonds: #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A; Molecule type: protein
A; Residues: 22-38,'H',40-42,'N',44-67,'T',69,'E',71-90,'N',92-124 <LAI>
A; Note: the difference at residue 70 may be due to deamidation during preparation

A; Molecule type: protein
A; Resperimental source: strain 340-3
C; Complex: the heat-labile enterotoxin molecule contains one A chain and five or six E
C; Function:
C; Function: the biological activity of the toxin is produced by the A chain, which
C; Reywords: enterotoxin

conserved hypothetical protein 263 - Odontella sinensis
C;Species: chloroplast Odontella sinensis
C;Date: 17-Feb-1998 #sequence_revision 26-Feb-1998 #text_change 20-Jun-2000
C;Accession: 378364
R;KOwallik, K.V.; Stoebe, B.; Schaffran, I.; Kroth-Pancic, P.; Freier, U.
Plant Mol. Biol. Rep. 13, 336-342, 1995
A;Title: The Chloroplast Genome of a chlorophyll a+c- containing Alga, Odontella sinensi
A;Reference number: 57838
A;Accession: 578364
A;Status: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Residues: 1-263 < KKOW>
A;Cross-references: EMBL: 267753; NID: 91185127; PIDN: CAA91737.1; PID: 91185254
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, November 1995
C;Genetics:
A;Gene: ycf43

Nucleic Acids Res. 18:1825-1832(1990).

-!- FUNCTION: THE RNA DEPRNDENT RNA POLYMERASE OF CORONAVIRUSES IS

A MULTIFUNCTIONAL PROTEIN: IT CONTAINS THE ACTIVITIES NECESSARY
FOR THE TRANSCRIPTION OF NEGATIVE STRANDED RNA, LEADER RNA,
SUBGENOMIC MRNAS AND PROGENY VIRION RNA.

-!- CATALYTIC ACTIVITY: N NUCLEOSIDE TRIPHOSPHATE = N PYROPHOSPHATE
